

THE COMPLETE BATHROOM INSTALLATION PLANNING CHECKLIST

A free printable checklist covering every stage of a successful bathroom installation project.

STAGE 1: PRE-PLANNING & DIAGNOSTICS

- Millimetre-Perfect Surveys:**
Measure structural wall-to-wall distances, door frames, ceiling clearances, and floor elevations prior to procuring furniture.
- Utilities & Pressure Validation:**
Evaluate main water flow rates, baseline pressure bars, and electrical consumer board capacity for high-amperage appliances.
- Ventilation Infrastructure Audit:**
Map mechanical inline extraction pathways out through structural boundaries to handle high moisture levels.

STAGE 2: PREPARATION & FIRST FIX

- Isolation & Strip-Out:**
Safely isolate primary incoming feeds before removing older fixtures, framing profiles, and legacy electrical paths.
- Timber Joist & Floor Verification:**
Inspect floor timbers for moisture decay or bounce; install thick timber sistering or marine plywood sub-decks where needed.
- First-Fix Supply & Drainage Run:**
Align fresh hot/cold supplies and verify precise gravity drops (minimum 1:40 ratio) for waste pipe corridors.

STAGE 3: ADVANCED TANKING & SURFACES

- Multi-Layer Waterproofing Barrier:**
Apply premium liquid-applied membranes along all wet surfaces, reinforcing corners with rubberised junction tape.
- Underfloor Thermal Network Placement:**
Lace down underfloor mats away from permanent installations and coat them evenly with flexible self-levelling compounds.
- Precision Symmetrical Tiling:**
Establish laser reference lines, lay large-format tiles using flexible adhesive, and seal with waterproof epoxy grouts.

STAGE 4: SECOND FIX & HANDOVER

Sanitaryware & Tap Mounts:

Mount floating vanities securely, set toilets with leak-proof seals, and finish premium brassware details.

Electrical & Accessories Integration:

Wire modern illuminated mirrors, extractors, and digital heating controls under certified regulatory conditions.

Hydraulic & Pressure Commissioning:

Run comprehensive water flow cycles across every fixture to inspect connections and balance thermal mixer valves.
